

# Focus on new tests and techniques in laboratory diagnosis of APS

**Katrien Devreese, MD, PhD**  
**Ghent University Hospital, Belgium**

# Antiphospholipid syndrome (APS)

- ▶ autoimmune disease
- ▶ antiphospholipid antibodies (aPL)
- ▶ thrombosis
- ▶ pregnancy morbidity

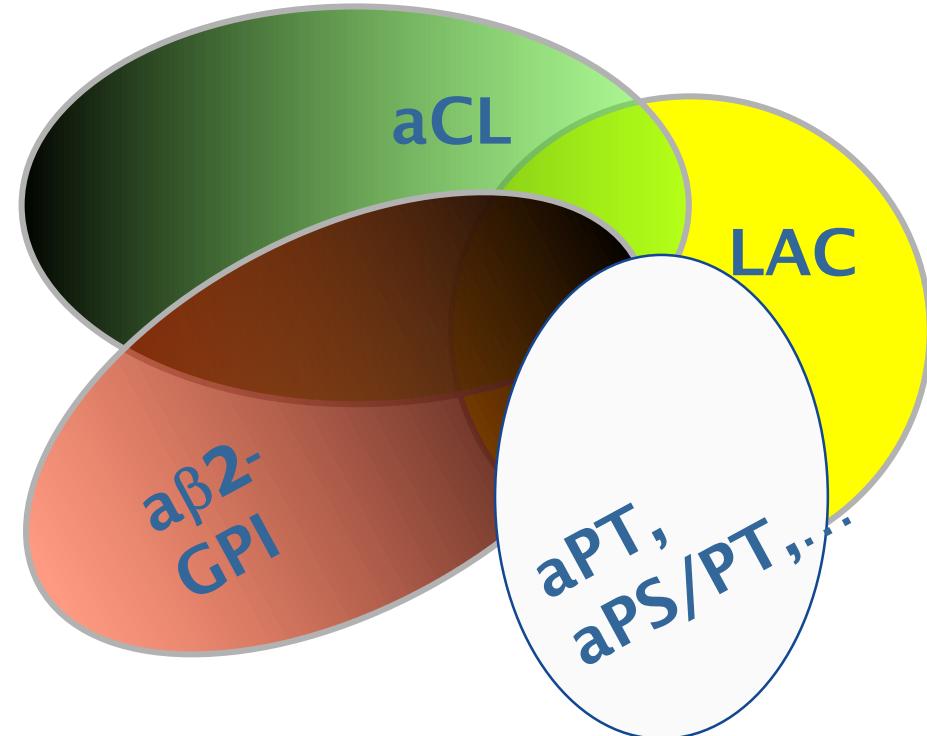

# Antiphospholipid antibodies (aPL)

Lupus anticoagulants  
(LAC)

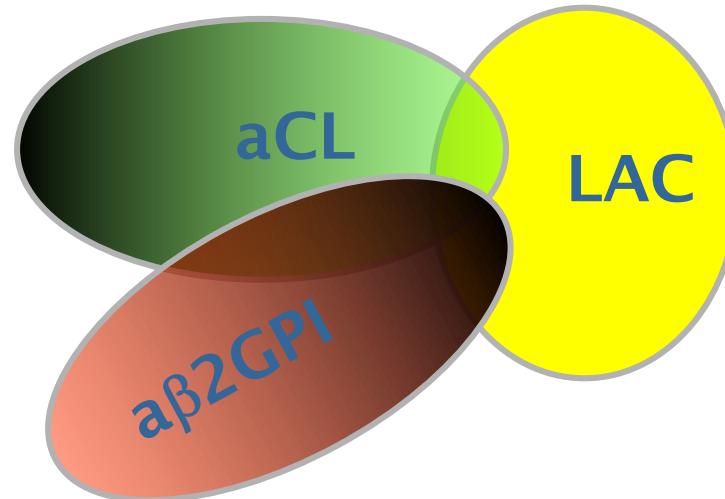

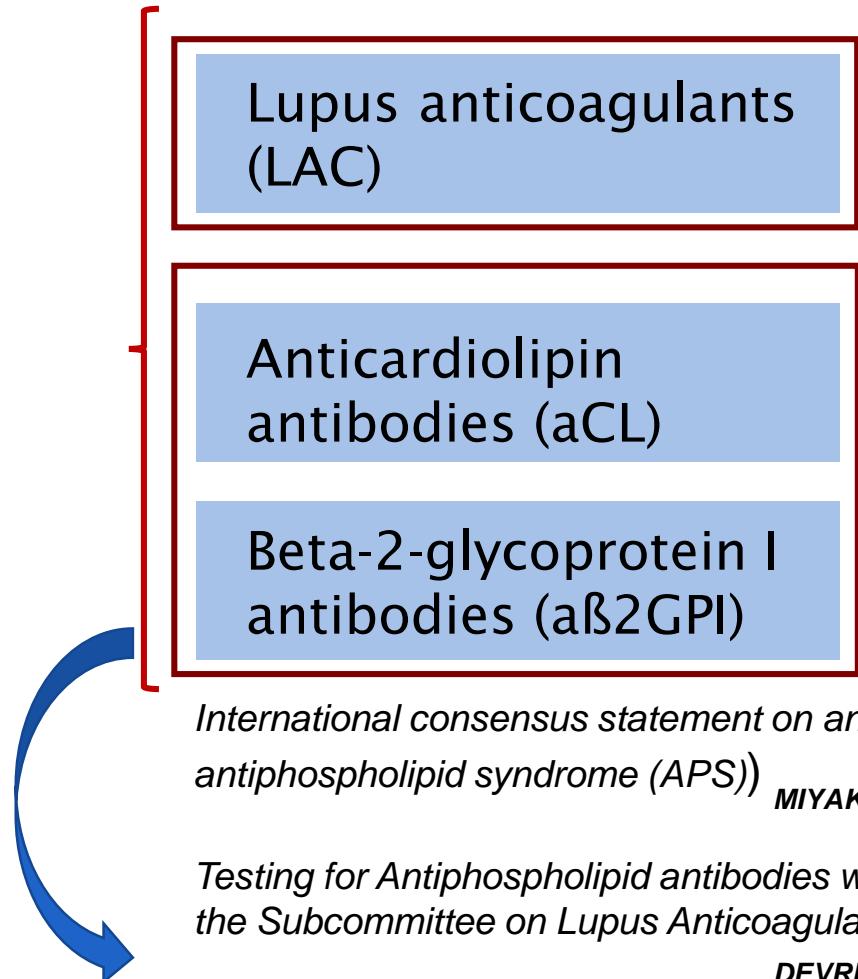

Anticardiolipin  
antibodies (aCL)

$\beta$ 2-glycoprotein I  
antibodies (a $\beta$ 2GPI)

Other  
Antiprothrombin, ...

# Antiphospholipid antibodies (aPL)

*International consensus statement on an update of the classification criteria for definite antiphospholipid syndrome (APS)*

MIYAKIS ET AL, J THROMB HAEMOST 2006; 4: 295-306

*Testing for Antiphospholipid antibodies with Solid Phase Assays: Recommendations from the Subcommittee on Lupus Anticoagulant/Phospholipid-Dependent Antibodies.*

DEVREESE ET AL, J THROMB HAEMOST 2014; 5:792-795

*Laboratory criteria for antiphospholipid syndrome: communication from the SSC of the ISTH.*

DEVREESE ET AL, J THROMB HAEMOST 2018; 16: 809–13

# Antiphospholipid antibodies (aPL)

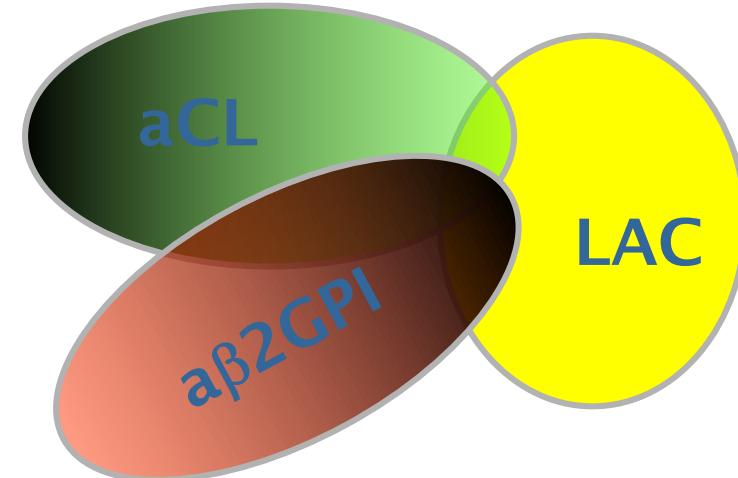

Lupus anticoagulants  
(LAC)

Anticardiolipin  
antibodies (aCL)

Beta-2-glycoprotein I  
antibodies(a $\beta$ 2GPI)

## Coagulation assays

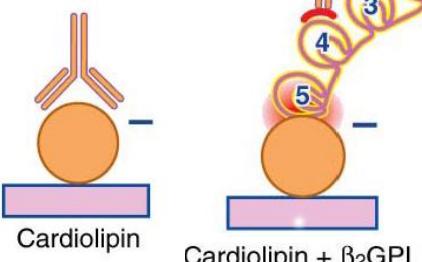

Functional antibodies: “all” aPL:  $\beta$ 2GPI antibodies, prothrombin antibodies, other?

## Solid phase assays

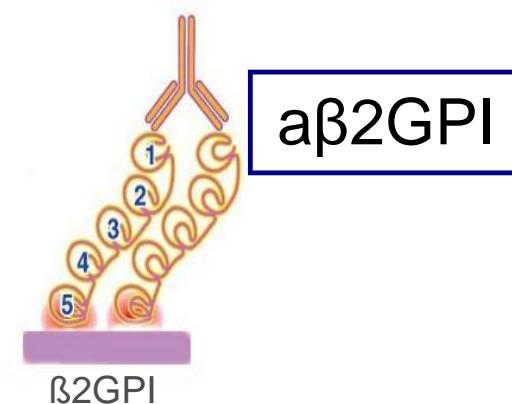

One group of antibodies

aCL

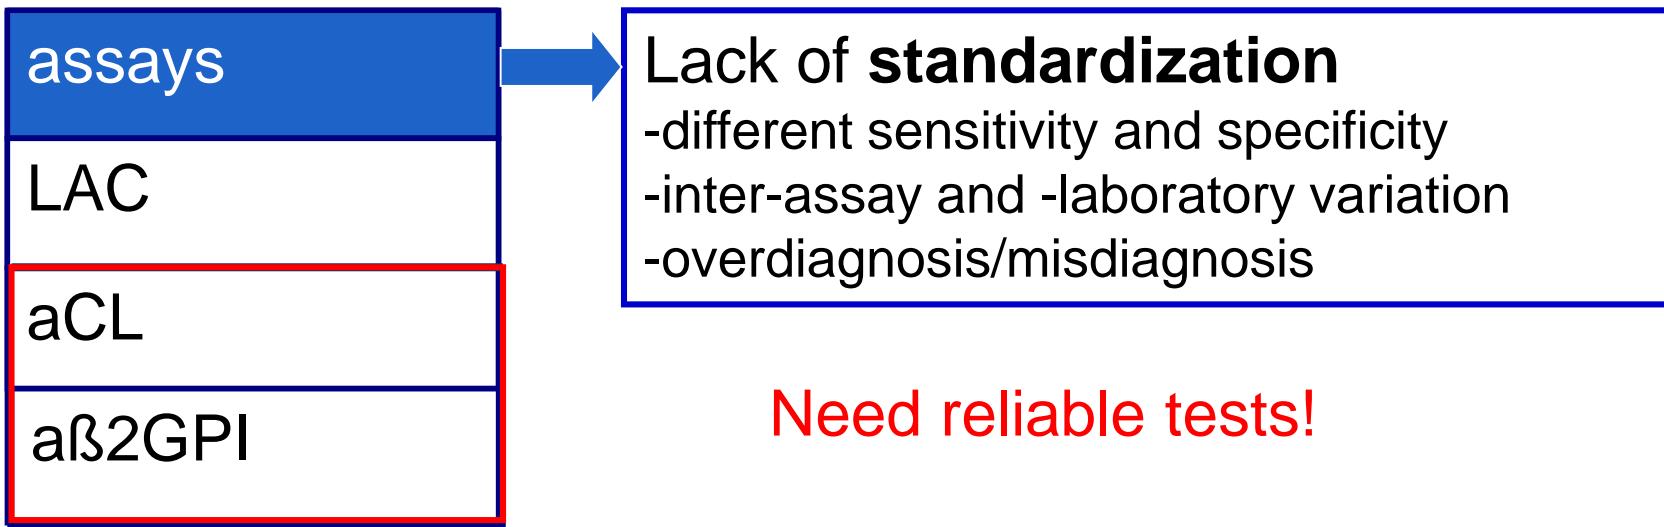

Cardiolipin +  $\beta$ 2GPI

a $\beta$ 2GPI

# Laboratory diagnosis of APS

## Variability due to pre-, post- and analytical conditions:

- Specific issues related to the assays
  - methodological problems due to the heterogeneity of aPL
  - variation in local working conditions
  - differences in calibration
- Difficulties in interpretation of results
- Calculation of cut-off values

## Thrombotic risk in APS

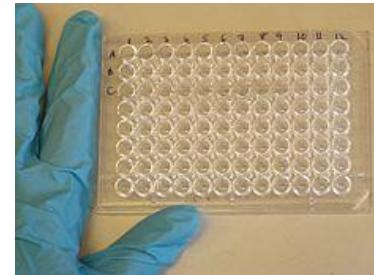

- Serological and clinical factors
  - Type and level of aPL
  - Coexistence of predisposing thrombotic risk factors
  - Association with underlying autoimmune diseases (SLE)
- the laboratory parameters in risk stratification for clinical complications in APS

# aCL and a $\beta$ 2GPI: methods

- ▶ Measured by standardized ELISA

International consensus statement on an update of the classification criteria for definite antiphospholipid syndrome (APS)

*MIYAKIS ET AL, J THROMB HAEMOST 2006; 4: 295-306*

- ▶ Guidelines: focused on ELISA

Guidelines on the investigation and management of antiphospholipid syndrome

*KEELING ET AL, BR J HEMATOL 2012*

- ▶ New technologies and automated platforms: alternative solid phases and detection systems

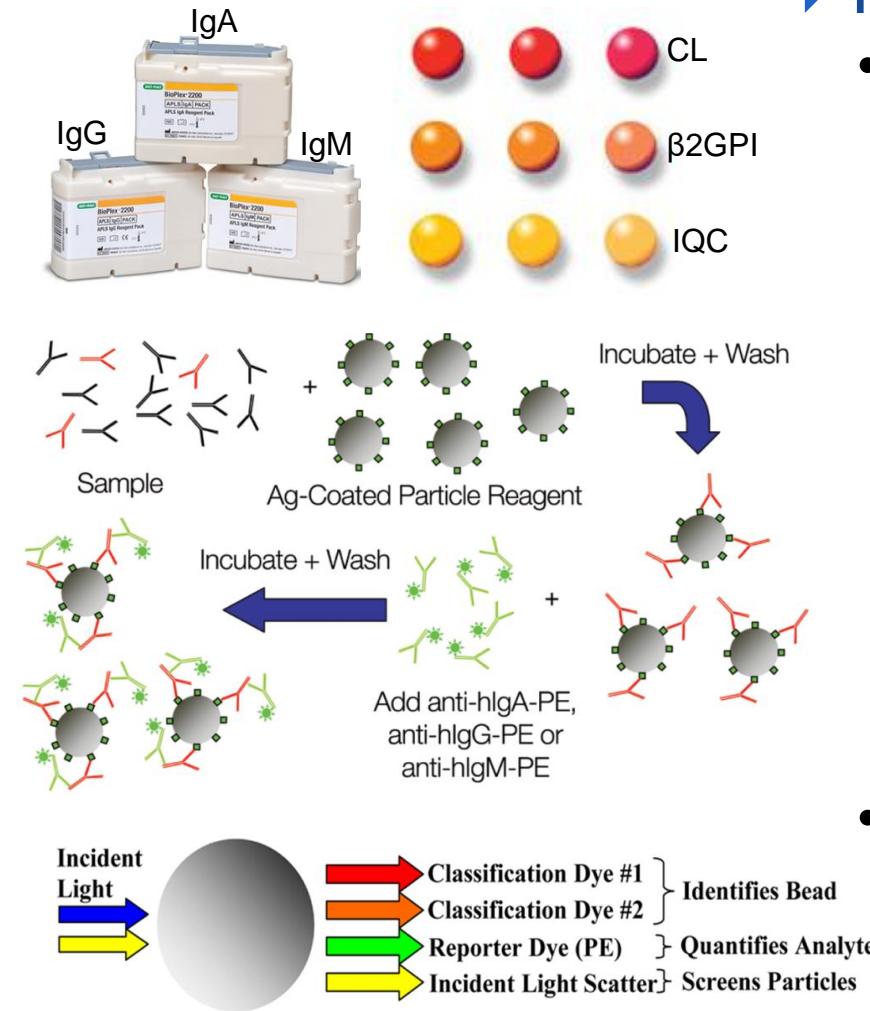

Testing for Antiphospholipid antibodies with Solid Phase Assays: guidance from the SSC of the ISTH

*DEVREESE ET AL, J THROMB HAEMOST 2014; 5:792-795*

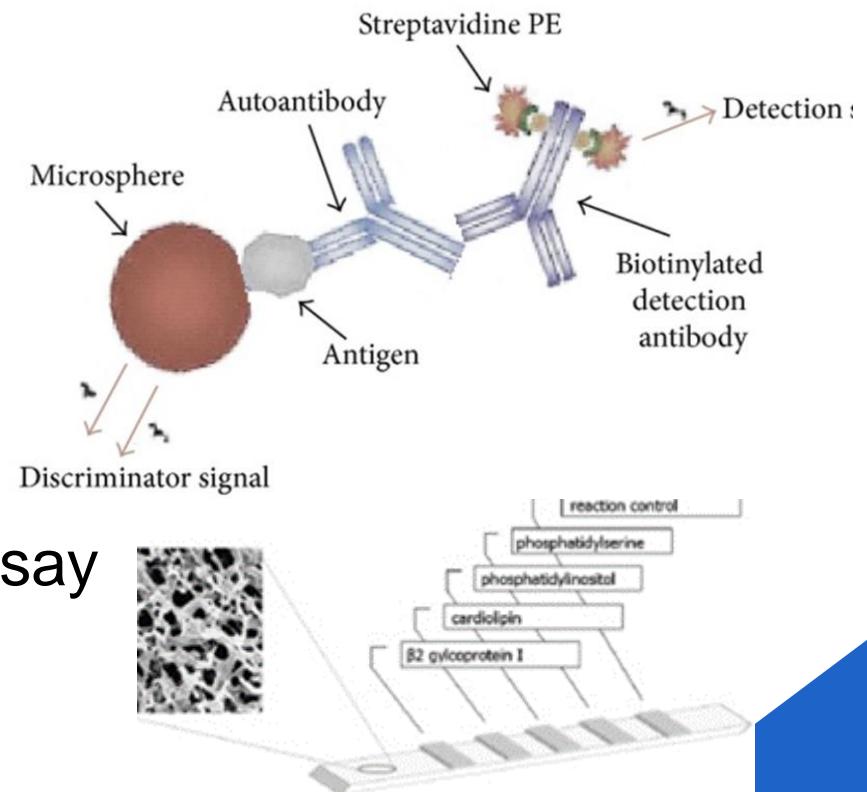

# aCL and a $\beta$ 2GPI: methods

## ► Multiplex format

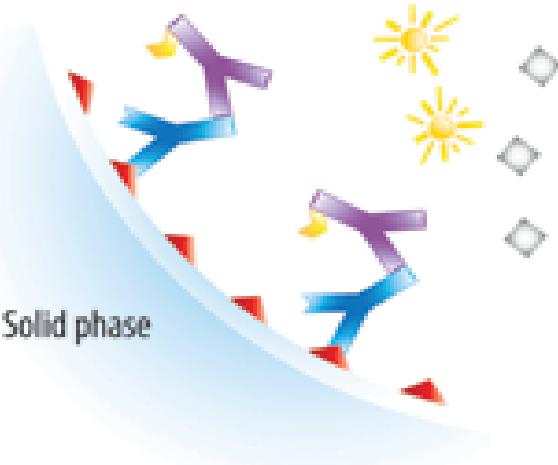

- Microbead-based
  - Bioplex 2200 (BioRad): multiplex flow immunoassay technology, fluorochrome
  - Luminex (Theradiag.)

- Multi-line Immunodot assay

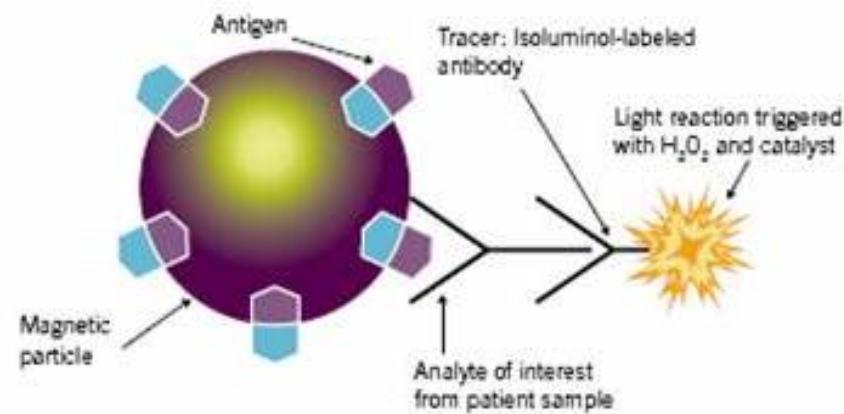

# aCL and a $\beta$ 2GPI: methods

## ► Coated polystyrene cups

- EliA (Phadia-ThermoFischer): fluorescense enzyme immunoassay

## ► Magnetic beads, chemiluminescence

- Acustar, BioFlash (Werfen; IL, Inova)
- Zenit RA (Menarini)

# aCL and a $\beta$ 2GPI: methods

## ▶ Automated systems

- ▶ Easy to perform
- ▶ More strict protocols
- ▶ Harmonized working conditions
  - Good reproducibility
  - Less inter-lab and intra-lab variation for one system

# aCL and a $\beta$ 2GPI: precision

## Between-run imprecision

- ▶ ELISA: < 20% (15%)
- ▶ Automated systems: < 10%

DEVREESE ET AL, ISTH-SSC RECOMMENDATIONS, J THROMB HAEMOST 2014; 12: 792-5

# aCL and a $\beta$ 2GPI: assay agreement

## Multicenter solid phase assay study

Agreement between commercial assays for aPL detection

- ▶ 1168 samples from eight European centers, including APS, AID, diseased controls, healthy controls.
- ▶ aCL and a $\beta$ 2GPI IgG/IgM, determined by a single technician, 4 platforms

Participants	Center	Manufacturer	
K. Devreese	Ghent University Hospital	AcuStar HemosIL	Werfen/IL
D. Wahl/ S. Zuijly	Centre hospitalier universitaire de Nancy	BioPlex 2200	BioRad
A. Tripodi	Angelo Bianchi Bonomi Hemophilia and Thrombosis Center, Milano	EliA	Phadia/ThermoFisher
G. Moore	Diagnostic Haemost & Thromb Laboratory, St Thomas' Hospital, London	Quanta Lite ELISA	Werfen/INOVA
J. Musial	Jagiellonian University Medical College, Krakow, Poland		
P. Fontana	University Hospital Geneva, Switzerland		
J. Remijn	Gelre hospitals, Apeldoorn, the Netherlands		
J.C. Gris	Centre Hospitalier Universitaire, Nîmes, France		

# aCL and a $\beta$ 2GPI: agreement

## Agreement between methods

Multicenter solid phase assay study; total population n= 1168  
APS thrombosis n=259, Non-APS thrombosis n=204, AID+HC  
n=390, APS obstetric n= 122, non-APS obstetric n= 33, normal  
pregnancy n= 100, unspecified APS n=60

- good-very good agreement between methods for aCL IgG, a $\beta$ 2GPI IgG and a $\beta$ 2GPI IgM positivity
- moderate agreement for aCL IgM positivity

# aCL and a $\beta$ 2GPI: agreement

## Clinical performance: agreement

- aPL positive samples not in agreement across the platforms showed lower median aPL titers than positives in agreement
- the majority of discrepant patients showed clinical manifestations of APS

# aCL and a $\beta$ 2GPI: agreement

## Clinical performance: sensitivity and specificity

Multicenter solid phase assay study

APS thrombosis n=259, Non-APS thrombosis n=204  
+ AID+HC: n=390

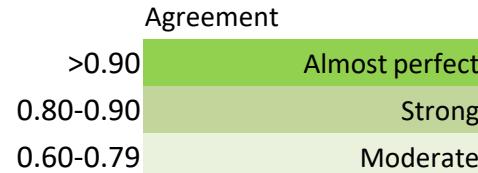

- Sensitivity and specificity differs between platforms

# aCL and a $\beta$ 2GPI: agreement

## Clinical performance: antibody profiles

AID controls (n=196)	56	22	18	19	14
Controls (n=193)	16	6	6	4	3
Total patient population (n=851)	274	146	125	134	106

- triple positivity detection differs between platforms

# aCL and a $\beta$ 2GPI: clinical performance

## Odds ratio for thrombosis

Multicenter solid phase assay study  
APS thrombosis n=259, Non-APS thrombosis  
n=204  
+ AID+HC: n=390

- Association of aCL/a $\beta$ 2GPI IgG and IgM positivity and thrombosis is variable per method detection

# aCL and a $\beta$ 2GPI: clinical performance

## Clinical performance: antibody profiles

Multicenter solid phase assay study  
APS thrombosis n=259, Non-APS thrombosis  
n=204  
+ AID+HC: n=390

- Clinical association was globally concordant between solid phase test systems considering antibody profiles
- Considering all aPL, OR differ, measuring the four aPL with one test system

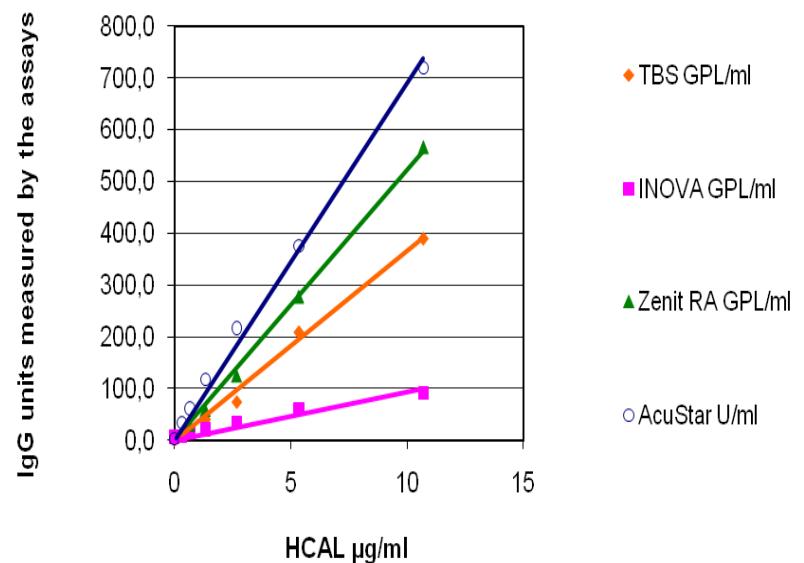

# aCL and a $\beta$ 2GPI: agreement

## Titer comparison between methods

IgG Sapporo standard (HCAL) 10.7 µg/ml

- ELISA (Inova, The Binding Site)
- automated systems (Zenit, AcuStar)
- both CLIA

aCL IgG

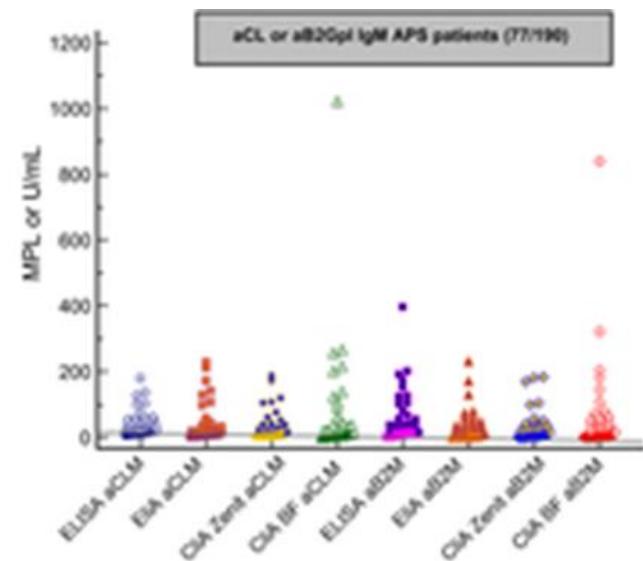

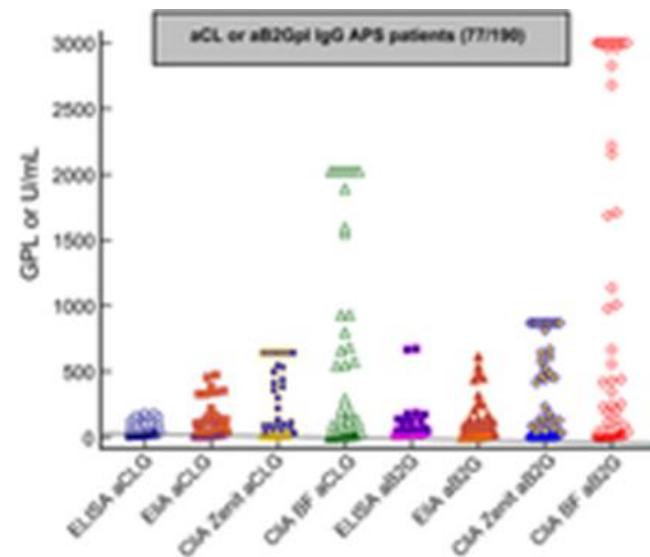

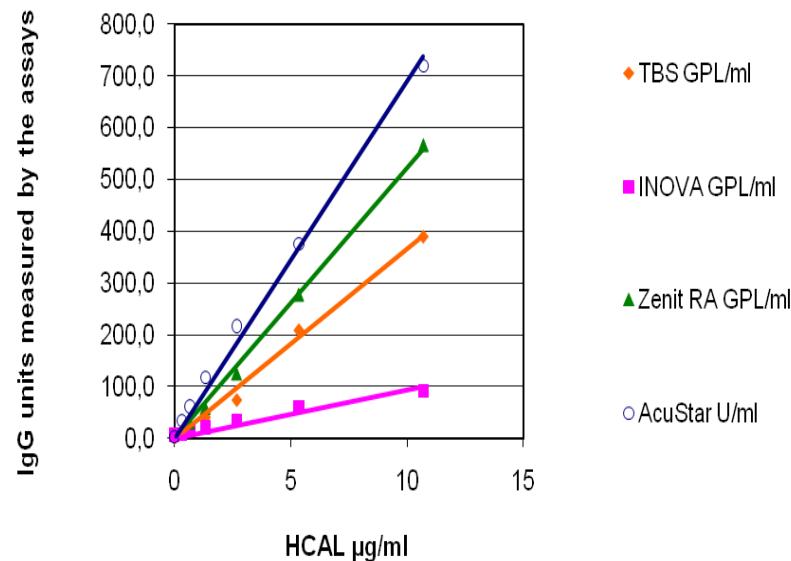

# aCL and a $\beta$ 2GPI: agreement

## Titer comparison between methods

IgG Sapporo standard (HCAL) 10.7 µg/ml  
-ELISA (Inova, The Binding Site)  
-automated systems (Zenit, AcuStar)  
both CLIA

Comparison of different immunoassays in APS and non-APS patients  
-ELISA (Inova)  
-automated systems (Phadia, Zenit, BioFlash)

### aCL IgG

# aCL and a $\beta$ 2GPI: agreement

## Titer correlation between methods

Multicenter solid phase assay study; total population n= 1168  
APS thrombosis n=259, Non-APS thrombosis n=204, AID+HC  
n=390, APS obstetric n= 122, non-APS obstetric n= 33, normal  
pregnancy n= 100, unspecified APS n=60

- aCL/a $\beta$ 2GPI IgG and a $\beta$ 2GPI IgM titer showed a good-very good correlation
- Apart from Bioplex-Acustar, there is only a moderate aCL IgM titer correlation between the platforms

## ► Two other types of in-house ELISA

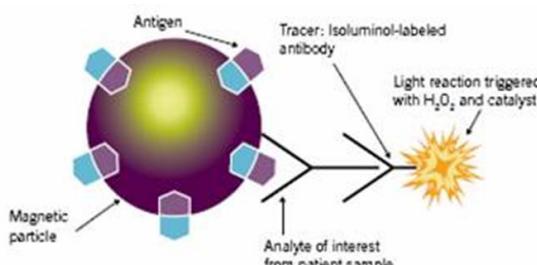

- A direct aDI ELISA (*COUSINS ET AL. ANN RHEUM DIS 2015; 74: 317-319; PERICLEOUS ET AL. PLOS ONE 2016; 11: E0156407*)
- A competitive inhibition ELISA (*Pozzi ET AL, PROTEIN SCI 2010; 19:1065-1078; BANZATO ET AL. THROMB RES 2011; 128:583-586*)

## ► Commercial ELISA (INOVA)

*(ANDREOLI ET AL, ANN RHEUM DIS 2011; 70: 380-383; ANDREOLI ET AL, ARTHRITIS RHEUMATOL 2015; 67: 2196-2204; AKHTER ET AL. J RHEUMATOL 2013; 40: 282-286)*

## ► Chemiluminescence assay QUANTA Flash® assay (BioFlash/ Acustar, Werfen)

- Since 2014
- 17 published studies

# Non-criteria aPL: anti-domain I $\beta$ 2GPI

- significant correlation with thrombosis
- lower sensitivity compared to  $\beta$ 2GPI IgG, higher specificity

	a $\beta$ 2GPI (20 CU)	a $\beta$ 2GPI (164 CU)	$\beta$ 2GPI-aD1 (20 CU)	$\beta$ 2GPI-aD1 (190 CU)
Sensitivity %			34.9	
Specificity %			99.5	
OR	2.3	4.1	4.0	8.7

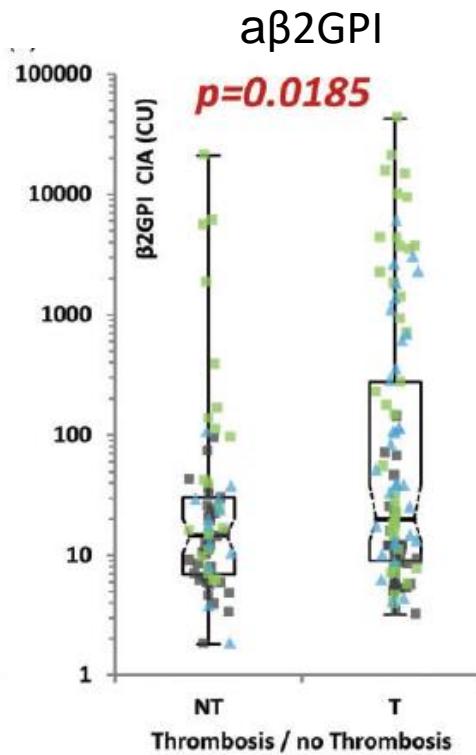

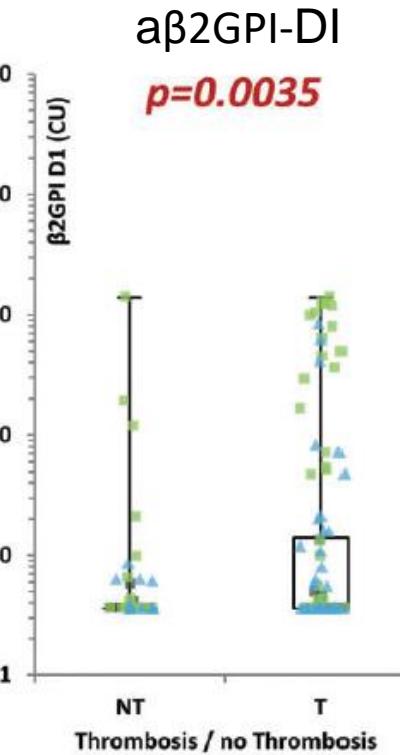

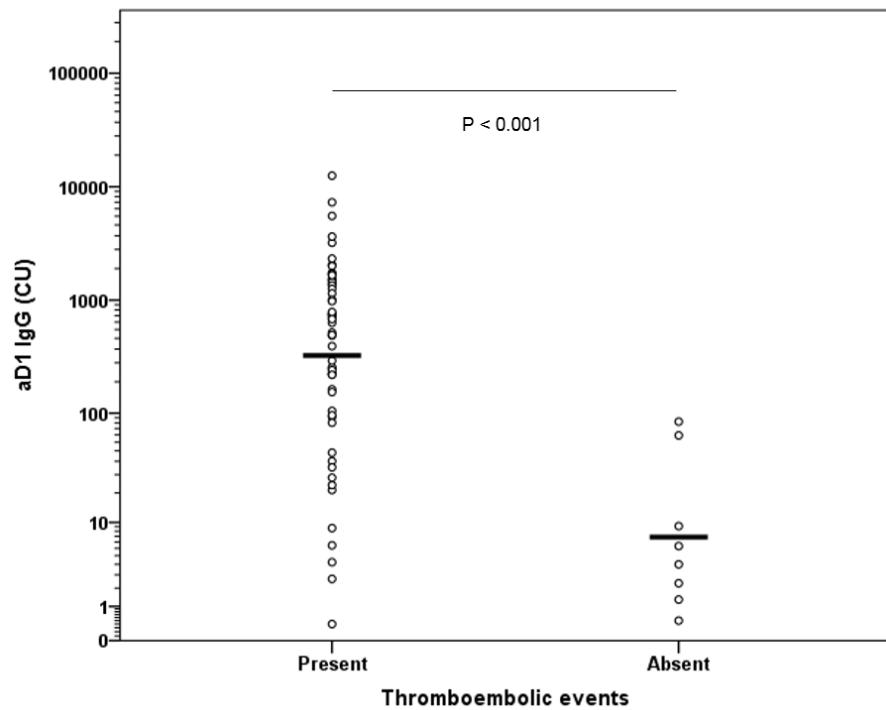

MAHLER ET AL, LUPUS 2016, 25:911-916

	a $\beta$ 2GPI (20 CU)	a $\beta$ 2GPI (60 CU)	$\beta$ 2GPI-aD1 (20 CU)	$\beta$ 2GPI-aD1 (44 CU)
sensitivity		56.4	53.5	48.5
specificity		99.1	97.8	99.1
OR		139	52.2	101

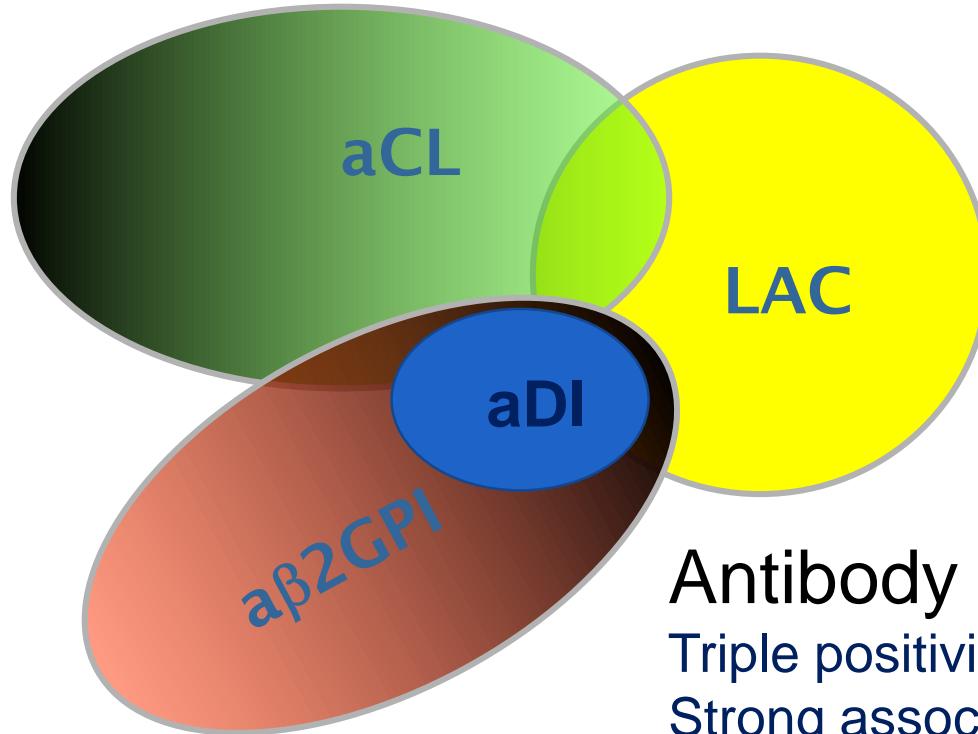

DE CRAEMER ET AL, J THROMB HAEMOST 2016, 14:1779-87

# Non-criteria aPL: anti-domain I $\beta$ 2GPI

- higher titers of aDI in thrombotic patients

# Non-criteria aPL: anti-domain I $\beta$ 2GPI

**Antibody profiles:**  
Triple positivity = patients at risk  
Strong association with anti-domain I  $\beta$ 2GPI (aDI)

# Non-criteria aPL: anti-domain I $\beta$ 2GPI

292/ 426 patient samples (APS, AID, DC, HC),  
positive for IgG a $\beta$ 2GP1

65 individuals over the three groups, all  
positive for IgG a $\beta$ 2GP1

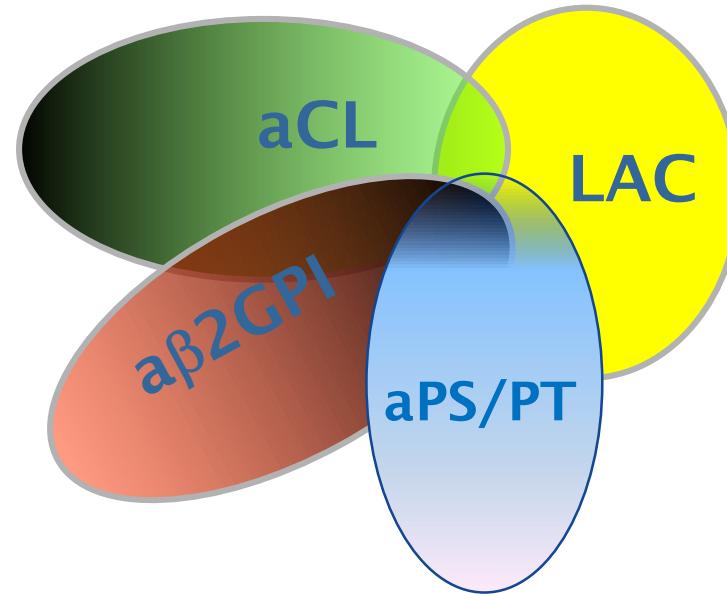

DE CRAEMER ET AL, J THROMB HAEMOST 2016, 14:1779-87

PENG ET AL, J THROMB HAEMOST 2015, 14:1779-87

# Non-criteria aPL: Anti-prothrombin/phosphatidyl serine

- ▶ Only ELISA (in-house, commercial)
- ▶ Good agreement between two commercial assays (MBL, INOVA)
- ▶ Promising results
- ▶ Often associated with LAC
- ▶ Few studies in animal models
- ▶ Unknown epitope on prothrombin to which antibodies are directed
- ▶ Clinical significance is further investigated

# CONCLUSIONS

- ▶ Automated systems are easy to apply with less variation in local working conditions
- ▶ Detecting several aPL (aCL, a $\beta$ 2GPI IgG/IgM) simultaneously in one sample
- ▶ More rapid and less labor intensive: alternative to running multiple ELISAs
- ▶ Between-run imprecision and inter-lab variation of newer systems is good and lower compared to ELISA
- ▶ New (automated) assays perform well (sensitivity, specificity) but differences between platforms
  - ▶ This may hamper uniformity in the classification of aPL positive samples
- ▶ Moderate (aCL IgM)/ (very) good qualitative (aCL IgG, a $\beta$ 2GPI IgG and a $\beta$ 2GPI IgM) agreement for positivity
- ▶ No comparison between numerical values of titers, but correlation is good for aCL/a $\beta$ 2GPI IgG and a $\beta$ 2GPI IgM
  - Opportunity to classify into low-medium-high titers

# CONCLUSIONS

- ▶ The number of triple positive patients depends on the platform
  - ▶ However, independently of the platform, triple positivity is a very sensitive biomarker to identify patients with thrombotic APS
  - ▶ The strength of the thrombotic association depends on the platform used
- ▶ Diagnostic accuracy is comparable: Odds ratio for clinical complications considering all aPL together were concordant.
  - ▶ Measurement of the four aPL with one system
- ▶ Classification of APS patients and follow-up is preferable performed with the same system
- ▶ **One step closer towards harmonisation**

THANK YOU FOR YOUR ATTENTION
